

VASI has our own in-house calibration workshop set up.

We perform Calibration of hydraulic, pneumatic and electric torque tools with capacity from 200 to 100 000 Nm according to ISO EN26789

We have internal calibration routines developed in cooperation with the manufacturers. We also perform dynamic calibrations up to 100 000Nm

In many cases, customers wanted to read dynamic (dynamometric) and we have developed special rigs that perform such tests up to 100 000Nm

Sending torque tools for calibration to us means less downtime, lower freight costs, full traceability and special trained calibration technicians.

We calibrate not only tools supplied by VASI, but also equipment from other manufactures. If the tools don not fit our equipment, we can make special adaptors to make them fit
